

SAW MILL RIVER FECAL INDICATOR BACTERIA DATA

Results are measured in Most Probable Number (MPN) of colony forming *Enterococcus* bacteria per 100 mL sample.

EPA recommends public notification and possible temporary beach closure for a single *Enterococcus* sample above 60 cells/ 100 mL. Samples testing above this threshold appear in **red** on the Riverkeeper website, while those below it appear in **green**. To avoid exposure to chronic contamination, the geometric mean, a weighted 30-day average, should not exceed 30 cells/ 100 mL. To avoid exposure to occasional high levels of contamination, no more than 10% of samples should exceed 110 cells/ 100 mL.

PLEASE NOTE:

AUGUST SAMPLERS WERE GIVEN THE OPTION TO SAMPLE ON 8/13 OR 8/27. SAMPLES WITH A * WERE SAMPLED ON THE 27TH. DUE TO STUDENT RESEARCH, WE WERE ABLE TO COLLECT A NUMBER OF SAMPLES FROM JFK MARINA AND YONKERS PADDLING AND ROWING CLUB THIS MONTH. THE RESULTS FROM THESE SITES ARE CALCULATED AS A GEOMETRIC MEAN (GM).
